Background

- Focus will be how I teach intro statistics and data science courses
- I use R, but many of these ideas are language agnostic
- Students of many different majors/backgrounds
- Most with high school math, almost none with coding experience

Background

- Most with high school math, almost none with coding experience

Question

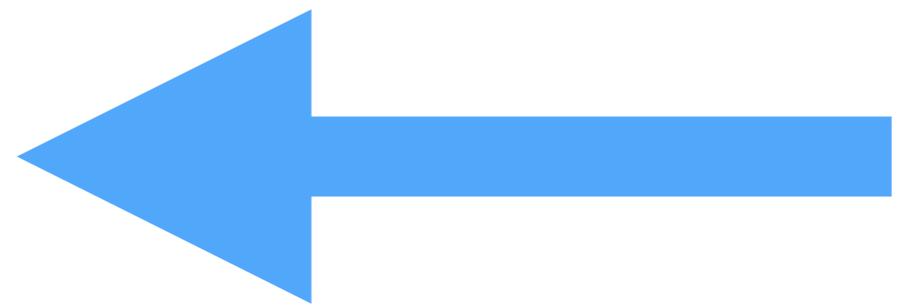

How can we teach ***data and computation*** novices:

1. **Data science**: Data visualization & data wrangling
2. **Data modeling**: Explanation (causal inference) & prediction (machine learning)
3. **Statistical inference**: sampling distributions, standard errors, confidence intervals & p-values

The Science of Education:
Back to School

Analogy: Learning Long Division

Do this a few times:

A handwritten long division problem on yellow lined paper. The divisor is 6, the dividend is 250, and the quotient is 41. The calculation is shown as follows:
6) 250
- 24

10
- 6

4

A red curved arrow starts from the digit 4 in the quotient and points to the remainder 4 at the bottom right.

wikiHow to Do Long Division

Then rely on this:

ggplot2 via the Grammar of Graphics

To create this plot:

① Load ggplot2 package
library(ggplot2)

② Example of a function call (problem set 02)

to create plot in tweet

```
ggplot(data=example, aes(x=A, y=B, color=D)) +  
  geom_point()
```

Annotations:
- 'aes' is labeled 'aesthetic'
- 'x=A' and 'y=B' are labeled 'data variable's'
- 'color=D' is labeled 'color'
- 'geom_point()' is labeled 'geometric object in question'
- 'example' is labeled 'where variables exist'

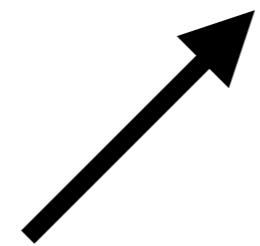

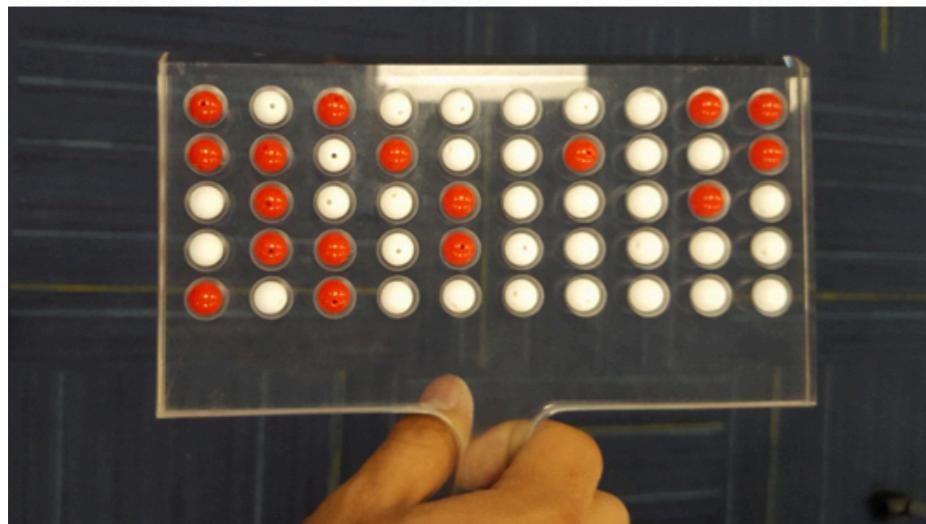

Recall:

A statistical graphic is a mapping of data variables to aesthetic attributes of geometric objects.

Five Named Graphs 5 NG

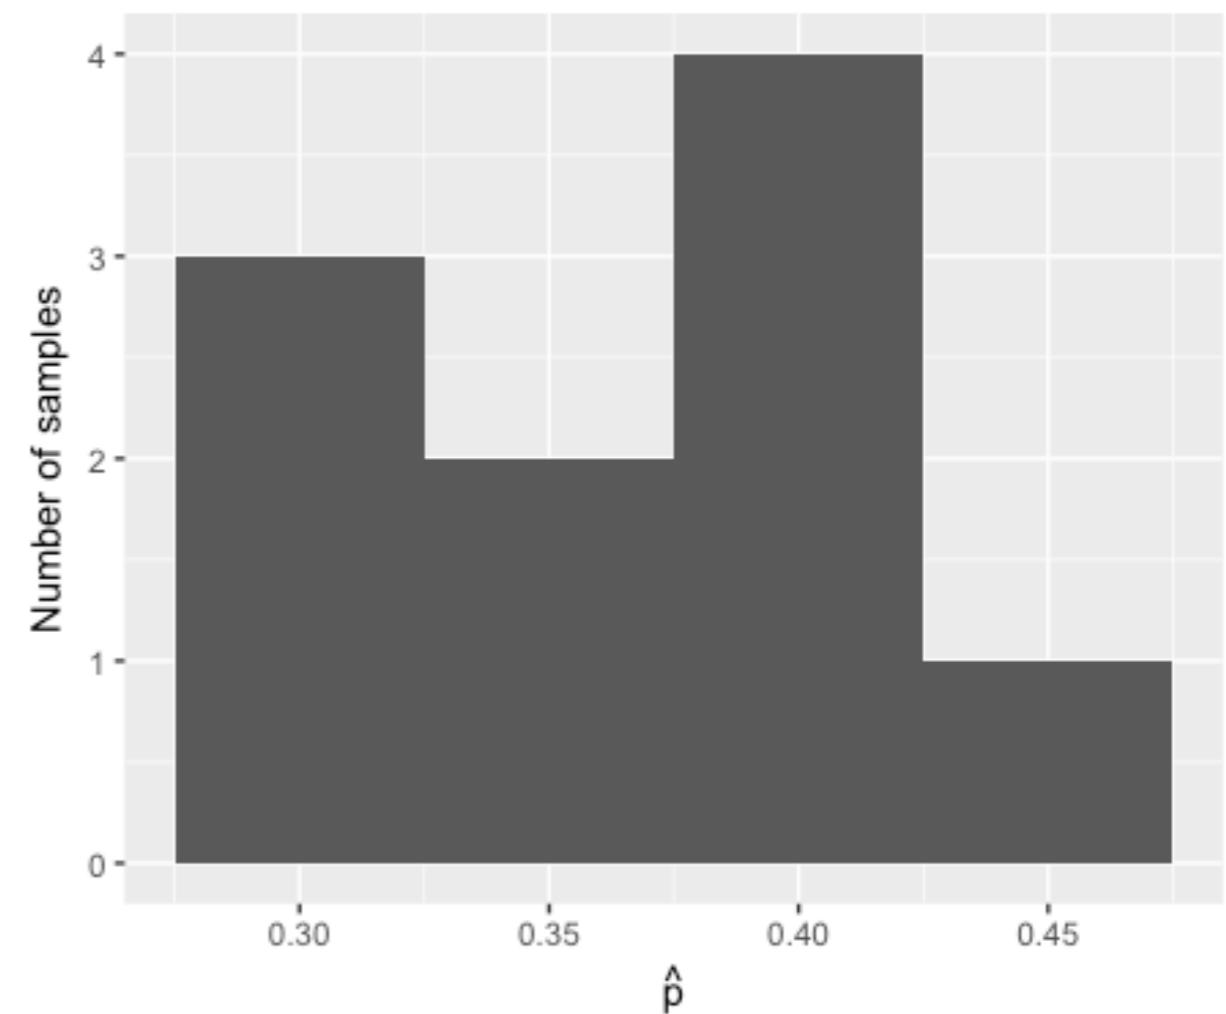

- ① Scatterplots geom_point()
- ② Line graphs geom_line()
- ③ Histograms geom_histogram()
- ④ Boxplots geom_boxplot()
- ⑤ Barplots geom_bar()

Tactile simulation of sampling to teach sampling distributions

Sampling distribution of \hat{p} based on $n = 50$

Computer simulation of sampling to teach sampling distributions

```
> library(moderndive)
> bowl
# A tibble: 2,400 x 2
  ball_ID color
  <int> <chr>
1      1 white
2      2 white
3      3 white
4      4 red
5      5 white
6      6 white
7      7 red
8      8 white
9      9 red
10     10 white
# ... with 2,390 more rows
```

Coding

Teaching Coding: The Battle is Psychological

- “Don’t code from scratch, take the copy/paste/tweak approach”
- “Computers are stupid!”
- “Learning to code is similar to learning a language”

New Tools Specific for Data Science

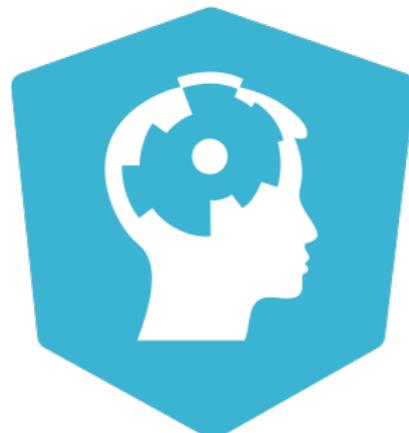

David Robinson

Data Scientist at Stack Overflow, works in R and Python.

Teach the tidyverse to beginners

A few years ago, I wrote a post [Don't teach built-in plotting to beginners \(teach ggplot2\)](#). I argued that ggplot2 was not an advanced approach meant for experts, but rather a suitable introduction to data visualization.

Many teachers suggest I'm overestimating their students: "No, see, my students are beginners...". If I push the point, they might insist I'm not understanding just how much of a beginner these students are, and emphasize they're looking to keep it simple and teach the basics, and that that students can get to the advanced methods later....

DataCamp

Immediate Feedback

- They will have had practice failing with support.
- Obvious stuff:
 - Matching parentheses
 - Misspellings

Without DataCamp: # of Questions on Coding

With DataCamp: # of Questions on Coding

The screenshot shows the RStudio interface with the following components:

- Top Bar:** RStudio, File, Edit, Code, View, Plots, Session, Build, Debug, Profile, Tools, Window, Help.
- Toolbar:** Go to file/function, Addins.
- File Path:** ~/Documents/moderndive/moderndive_book - master - RStudio
- Code Editor:** The active file is 03-visualization.Rmd. The code includes R code for creating a boxplot and text explaining its components. It also contains several `**`r paste0`` blocks for learning checks and questions.
- Build Options:** A dropdown menu shows "All Formats" selected, with "bookdown::gitbook" highlighted.
- File Browser:** Shows the directory structure of the book project, including files like style.css, Rproj files for chapters, and various Rmd files for different chapters and appendices.
- Console:** The console output shows the path ~/Documents/moderndive/moderndive_book/ and a single line starting with '>'.

3.3.3 Summary

3.4 5NG#2: Linegraphs

3.5 5NG#3: Histograms

3.6 Facets

3.7 5NG#4: Boxplots

3.8 5NG#5: Barplots

3.9 Conclusion

4 Tidy Data via tidyverse

5 Data Wrangling via dplyr

II Data Modeling via moderndive

6 Basic Regression

ggplot(data = weather, mapping = aes(x = factor(month), y = temp)) +
geom_boxplot()

Figure 3.13: Month by temp boxplot

We have introduced a new function called `factor()` here. One of the things this function does is to convert a discrete value like `month` (1, 2, ..., 12) into a categorical variable. The “box” part of this plot represents the 25th percentile, the median (50th percentile), and the 75th percentile. The dots correspond to *outliers*. (The specific formulation for these outliers is discussed in Appendix A.) The lines show how the data varies that is not in the center 50% defined by the first and third quantiles. Longer lines correspond to more variability and shorter lines correspond to less variability.

This is because the various components of the Grammar of Graphics are specified in the ggplot function, which expects at a bare *minimal* as arguments: (this was in 3.1.4)

3.1.3 Other components of the Grammar

There are other components of the Grammar of Graphics we can control. As you start to delve deeper into the Grammar of Graphics, you'll start to encounter these topics more and more often. In this book, we'll only work with the two other components below (The other components are left to a more advanced text such as [R for Data Science](#) (Grolmund and Wickham 2016)):

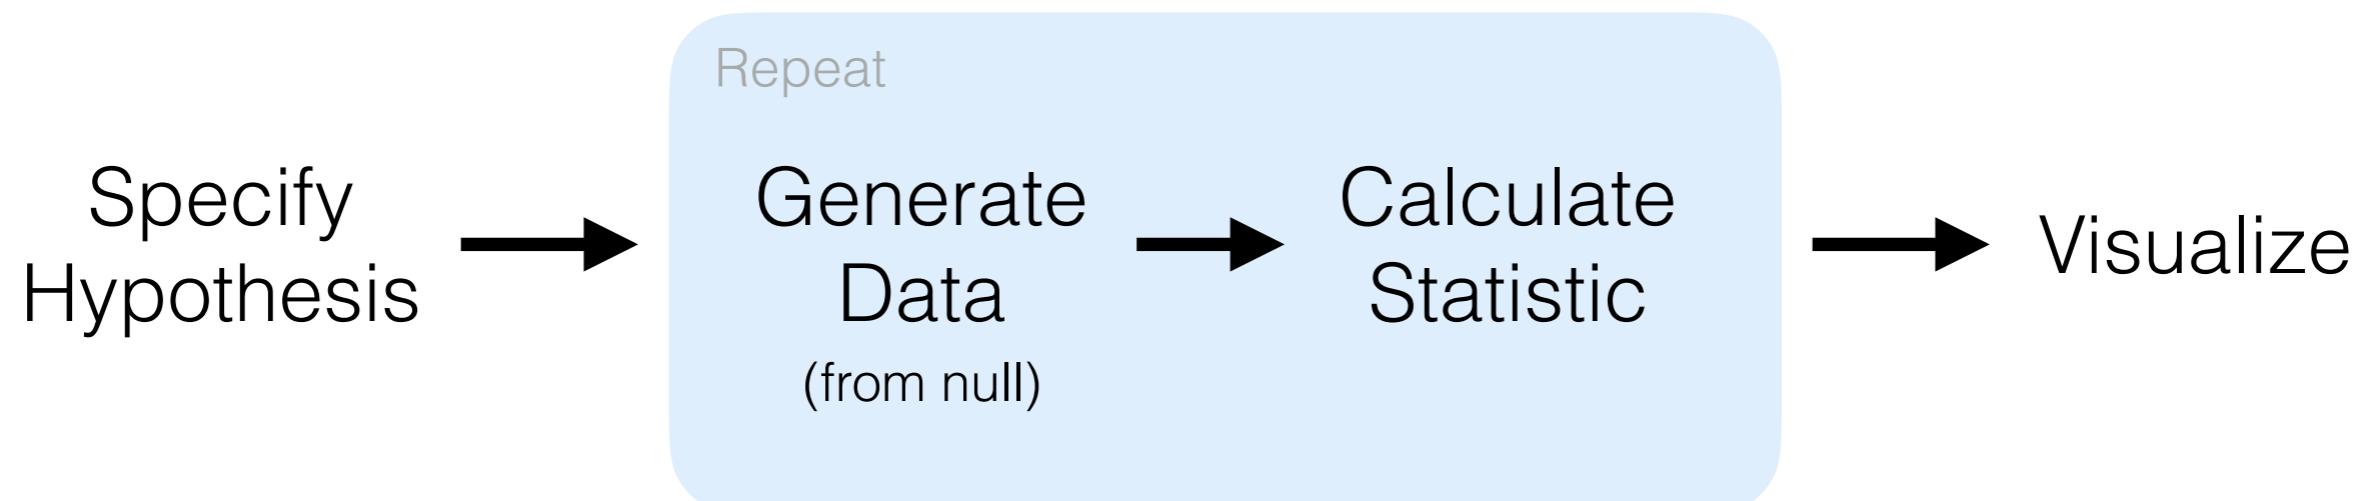

- `facet`ting breaks up a plot into small multiples corresponding to the levels of another variable (Section 3.6)
- `position` adjustments for barplots (Section 3.8)

“ facetting?
